

The Economy and Interest Rates 2014/15

By Capita Asset Services April 2015

The original market expectation at the beginning of 2014/15 was for the first increase in Bank Rate to occur in quarter 1 2015 as the unemployment rate had fallen much faster than expected through the Bank of England's initial forward guidance target of 7%.

In May, however, the Bank revised its forward guidance. A combination of very weak pay rises and inflation above the rate of pay rises meant that consumer disposable income was still being eroded and in August the Bank halved its forecast for pay inflation in 2014 from 2.5% to 1.25%.

Expectations for the first increase in Bank Rate therefore started to recede as growth was still heavily dependent on buoyant consumer demand. During the second half of 2014 financial markets were caught out by a halving of the oil price and the collapse of the cap between the Swiss franc and the euro. Fears also increased considerably that the ECB was going to do too little too late to ward off the threat of deflation and recession in the Eurozone.

In mid-October, financial markets had a major panic for about a week. By the end of 2014, it was clear that inflation in the UK was going to head towards zero in 2015 and possibly even turn negative. In turn, this made it clear that the MPC would have great difficulty in starting to raise Bank Rate in 2015 while inflation was around zero and so market expectations for the first increase receded back to around quarter 3 of 2016.

Gilt yields were on a falling trend for much of the last eight months of 2014/15 but were then pulled in different directions by increasing fears after the anti-austerity parties won power in Greece in January; developments since then have increased fears that Greece could be heading for an exit from the euro.

While the direct effects of this would be manageable by the European Union and the European Central Bank (ECB), it is very hard to quantify quite what the potential knock on effects would be on other countries in the Eurozone once the so called impossibility of a country leaving the EZ had been disproved.

Another downward pressure on gilt yields was the announcement in January that the ECB would start a major programme of quantitative easing, purchasing Eurozone government and other debt in March.

On the other hand, strong growth in the US caused an increase in confidence that the US was well on the way to making a full recovery from the financial crash and would be the first country to start increasing its central rate, probably by the end of 2015. The UK would be closely following it due to strong growth over both 2013 and 2014 and good prospects for a continuation into 2015 and beyond. However, there was also an increase in concerns around political risk from the general election due in May 2015.
